ECS Provisioning using Terraform

- We will provision the ECS using Terraform as an Infrasturcture as Code.
- We will deploy it in custom Virtual Private Cloud for isolation.
- We will connect the Container App to ECR for Docker Image.
- We will also create S3 bucket to store the .env file.
- Also will deploy RDS MySQL Instance to store the relational data and connect it to ECS.

Prerequisites

- 1. AWS Account with an IAM User with administrative permissions.
- 2. Terraform installed.

Steps

- 1. Create the **ecs-terraform** directory.
- 2. Folders structure for the above-created directory is as follows:

```
ecs-terraform

|---.terraform.lock.hcl
|---locals.tf
|---main.tf
|---outputs.tf
|---providers.tf
|---terraform.tfstate
|---terraform.tfstate.backup
|---.terraform
```

We need to only create *providers.tf*, *main.tf*, *outputs.tf*, & *locals.tf* file. Other files are generated while initiating terraform.

- 3. Create a *providers.tf* file inside the above-created directory.
- 4. Inside it, define the following:
 - o terraform
 - required_providers
 - o provider
 - docker
 - aws
- 5. Click code for reference.
- 6. The definition of *providers.tf* file is complete.
- 7. Now, create the *main.tf* file.
- 8. Inside main.tf file, we will use the following predefined modules:
 - o vpc
 - o s3

- o rds
- o ecr
- load-balancer
- o ecs
- 9. Also define the following s3 resource for uploading local .env file:
 - o aws_s3_object
- 10. Click code for reference.
- 11. The definition of *main.tf* file is complete.
- 12. Now we will create outputs.tf file.
- 13. Inside it, define the following outputs.
 - DB HOST
 - bastion-host-ip
- 14. Click code for reference.
- 15. The definition of *outputs.tf* file is complete.
- 16. Now we will create locals.tf file.
- 17. Inside it, define the following variables:
 - vpc-properties
 - o s3-properties
 - database-properties
 - bastion-properties
 - load-balancer-properties
 - ecs-properties
- 18. Click code for reference.
- 19. The definition of *locals.tf* file is complete.

Make sure you give the appropriate values to the varibles defined in *locals.tf* file. Also update the *s3-object-source-path* variable under *s3-properties* with local .*env* file relative path.

Provisioning the Infrastructure

Now we will provision the AWS infrastructure by applying the above-created configuration files.

Ensure AWS CLI is configured with appropriate AWS user credentials with enough permissions.

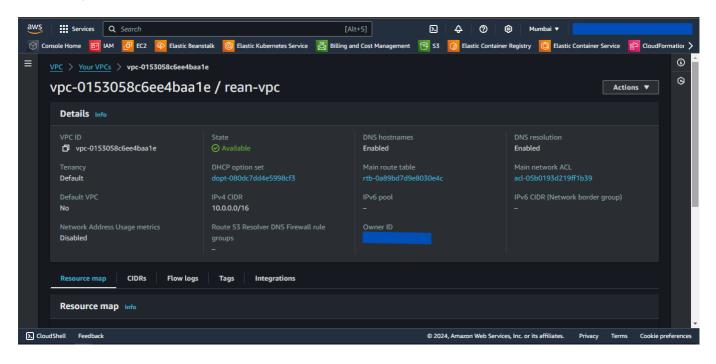

Steps:

- 1. Open the PowerShell.
- 2. Change the directory to the above-created **ecs-terraform** directory using **cd** command.
- 3. Run the terraform fmt -recursive command to format the syntax of the files.
- 4. Run the terraform init command to initialize the terraform.
- 5. Run the terraform validate command to validate the configuration files.
- 6. Run the terraform plan command to plan the resources to be created.
- 7. Run the terraform apply command and if prompted, type yes to provision the infrastructure.
- 8. Run the terraform output command to get the values of defined variables in outputs.tf file.
- 9. Head to the AWS Console, and verify the created resources.
- 10. Then.

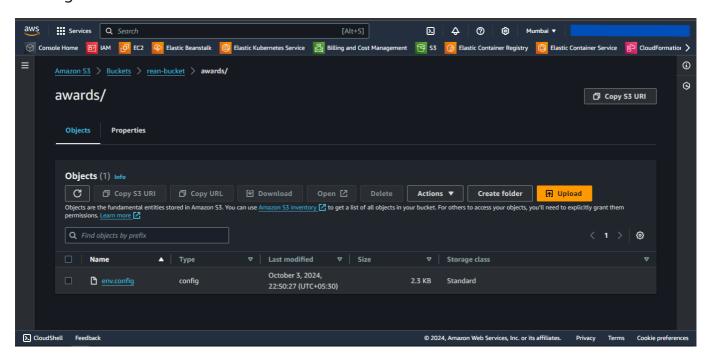

- Head towards EC2 dashboard.
- Select Load Balancers, and select the created load balancer.
- o Copy the DNS address.
- Paste the address in the browser to access the application.

Connection to the RDS database through Bastion Host using MySQL Workbench

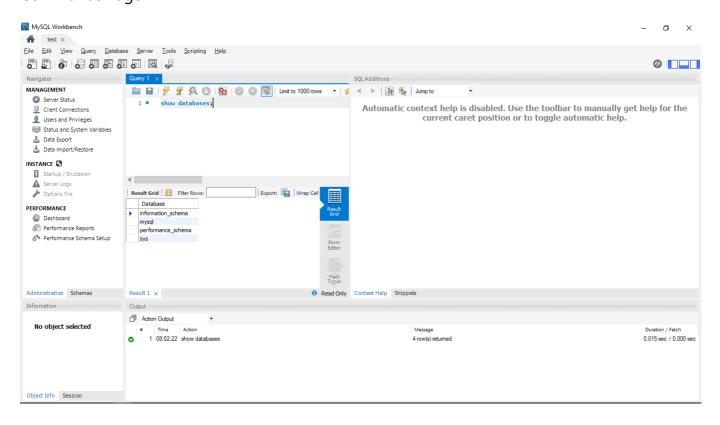

- 1. Open MySQL Workbench.
- 2. Click Add Connection.
- 3. Select connection method as **Standard TCP/IP over SSH**.
- 4. In SSH Hostname, enter *bastion-host-ip:22* where bastion-host-ip is received from the **terraform output** command.
- 5. In SSH Username, enter ec2-user.
- 6. In SSH Key File, select bastion-key.pem file passed in above locals.tf file from your local computer.
- 7. In MySQL Hostname, enter *DB_HOST* where DB_HOST is received from the **terraform output** command.
- 8. In the Password section, select *Store in Vault*, and enter the password passed in above-created *locals.tf* file.
- 9. Click OK and open the connection.
- 10. Now you can run mysql commands to access databases, and verify the successful connection of *ecs-container*.

Destroy the provisioned infrastructure

1. To destroy infrastructure, change directory to the above-created **ecs-terraform** directory using **cd** command.

- 2. Run terraform destroy & if prompted, type yes.
- 3. Infrastructure will be destroyed.
